

# Making Files And Folders Exercise

To get some practice creating files and folders from the command-line, we'll be creating a standard React project file structure. Don't worry at all if you don't know React, we're just making a bunch of empty files and folders!

1. Create a new folder called `my-app`
2. Navigate to `my-app` and inside create two new empty files called `README.md` and `package.json`
3. Still inside of `my-app` create a new folder called `public`. Without `cd`-ing into `public`, create an `index.html` file inside of it.
4. Create a new folder called `src` inside of `my-app`. Navigate inside of it.
5. Using a single line, create the following four files inside of `src`: `App.css`, `App.js`, `index.css`, and `index.js`

Your folder structure should now look like this:

```
my-app/  
  README.md  
  package.json  
  public/  
    index.html  
  src/  
    App.css  
    App.js  
    index.css  
    index.js
```

## BONUS

Using a single command, create a new directory inside of `src` called `components`, and inside of that new `components` directory create a new directory called `Navbar`. Do this using a single command, without first creating the `components` directory.
