```
2ivysaur
3venusaur
4charmander
5charmeleon
6charizard
7squirtle
8wartortle
9blastoise
10caterpie
11metapod
12butterfree
...
```

- Now that we have this file that includes all the Pokemon in numerical order, let's print out the three pigeon-related Pokemon: pidgey, pidgeotto, and pidgeot.  Using the command-line, print out lines 16-18.  It should look like this:

```
16pidgey
17pidgeotto
18pidgeot
```

- Next, up let's isolate the original 151 Pokemon.  Using a single pipeline...
  - output the first 151 lines of the `all-pokemon.txt` file
  - remove all digits 0-9 from the lines (using `tr` )
  - sort the now number-less lines alphabetically
  - store the new result in a file called `original-151.txt` in `PokemonExercise`

```
abra
aerodactyl
alakazam
...
wigglytuff
zapdos
zubat
```
